

TITLE- HYPERACUTE STROKE – THROMBOLYSIS AND THROMBECTOMY PATHWAY

TARGET AUDIENCE	Stroke Nurses, ED Medics / ANPs, Radiography/Radiology Clinicians and Stroke Physicians
PATIENT GROUP	Hyperacute Ischaemic Stroke

Clinical Guidelines Summary

- In line with the rest of the UK and Scotland, NHS Lanarkshire is moving to using Tenecteplase instead of Alteplase for Hyperacute Stroke presenting within 4.5 hours of symptom onset.
- This document describes the current thrombolysis / thrombectomy pathway, imaging acquisition and thrombolysis
- It includes a chart of Tenecteplase doses by weight and also instructions on how to administer the drug.

Hyperacute Stroke – Thrombolysis and Thrombectomy Pathway

Hyperacute Stroke <4.5 hours of onset

999 call and SAS time on scene

SAS Prealert

ED arrival Majors or Resus

Joint ED/Stroke Nurse Assessment ABCDE

Stroke Nurse completes NIHSS /neurological assessment

ED team - Bloods/ Green Cannula Right Arm and rule out other significant pathology e.g traumatic injury, medically unstable

Stroke nurse discusses with stroke consultant

Suitable for Thrombolysis or Thrombectomy

No
Usual care as per stroke pathways

Yes
Only request hyperacute CT scans once approved by stroke consultant

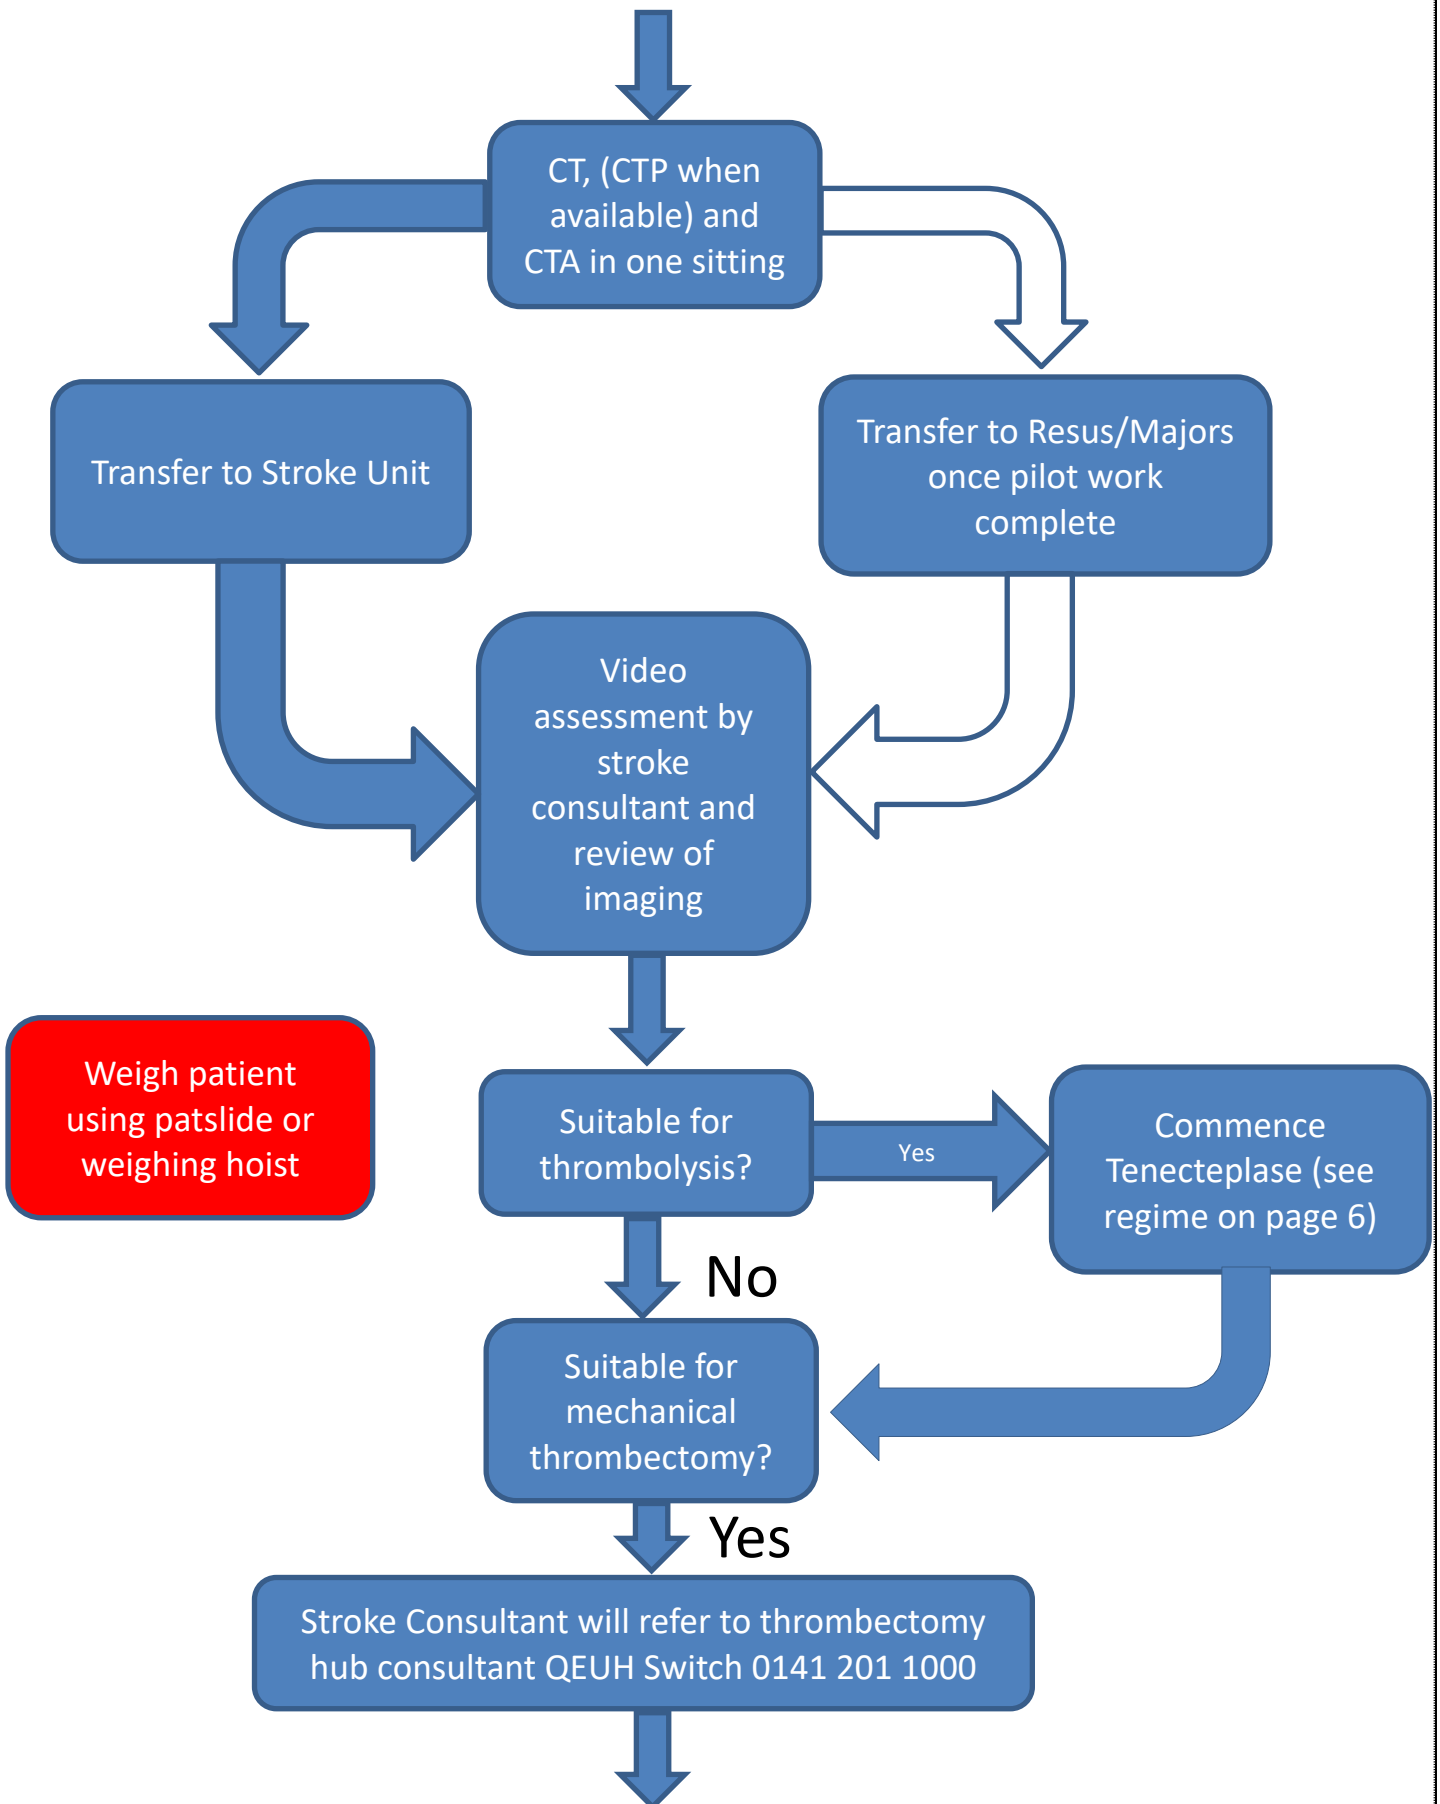

***Allergy / contrast reaction status must be checked as well as possible before imaging – D/W Stroke consultant if previous issues (see page 5)

Contact radiographer and request CT and CTA **

Stroke Consultant name and 'thrombolysis' or 'thrombectomy' to go on request. No need for eGFR (use XXX)

Hyperacute Stroke – Thrombolysis and Thrombectomy Pathway

** Imaging Requesting:

- Request CT Brain AND
- Request CT Angio Aortic Arch and Carotid both

The request must include the on call stroke consultant's name and that the patient is for potential thrombolysis or thrombectomy

- Check allergy status as thoroughly as possible with ECS and patient/family if possible. D/W stroke consultant before performing imaging if previous issues.

eGFR is not required for thrombolysis/thrombectomy imaging. Enter 'XXX' in the box. If known renal issues D/W stroke consultant before requesting

*** Previous allergy contrast reactions:

- Previous contrast reactions may be identified by the patient, listed as an allergy in ECS or recorded on the NHSL radiology system
- If there is a history of previous contrast reaction, do not request or perform CTP or CTA until discussed with Stroke Consultant
- In some circumstances, Non-contrast CT may be enough (e.g. if patient not suitable for thrombectomy)
- In patients with a previous mild contrast reaction, the risks of further reaction may be outweighed by the potential benefits of thrombectomy. This would only go ahead though after a discussion with the patient and/or NOK about the pros and cons.
- In a patient with a confirmed history of contrast allergy, the CTA/CTP would only then be requested by the stroke consultant remotely on TRAKCARE.
- Thrombectomy itself requires large volumes of contrast, so it unlikely that a patient who has had a previous severe contrast reaction would be suitable for thrombectomy

Hyperacute Stroke – Thrombolysis and Thrombectomy Pathway

Tenecteplase [1][2] administration:

Tenecteplase for treating ischaemic stroke comes in a 25 mg (5000U) vial. Tenecteplase is administered as a single IV bolus over 5 to 10 seconds. The dose is weight dependent and the maximum is 25mg.

Calculate the dose based on the patient's body weight.

Benefit-risk of Tenecteplase treatment should be carefully evaluated in patients weighing 50 kg or less due to limited availability of data. The weight-band table is derived from the AcT trial [3] and there was no evidence of any safety issues identified when following that dosing schedule. For myocardial infarction the lowest weight band is also <60kg and there have been no safety issues identified for using this lowest dose for all patients, no matter how far less than 60kg. If there is an individual safety concern in a patient <60kg, then a calculation could be made on the 0.25mg/kg basis, but this introduces risk around both the calculation and the accuracy of syringe measurement at such low volumes.

Patients' body weight category (kg)	Tenecteplase (mg)	Corresponding volume of reconstituted solution (ml)
< 60	15.0	3.0
≥ 60 to < 70	17.5	3.5
≥ 70 to < 80	20.0	4.0
≥ 80 to < 90	22.5	4.5
≥ 90	25.0	5.0

Details on how to prepare the drug can be found at <https://go.boehringer.com/RTz> and a training video is available at - <https://go.boehringer.com/R95yZ> .

If not opening directly on a NHSL device, then copy and paste into Chrome browser. This guideline will be formally reviewed at a minimum annually to ensure links are still functioning correctly.

A list of contraindications to thrombolysis is listed in a document at - <http://firstport2/staff-support/stroke/Documents/Stroke%20Thrombolysis/Stroke%20Thrombolysis%20%20Nurse%20Document.doc> .
